

## Used Forklift Parts

Used Forklift Parts - Inevitably, lift truck components would eventually wear out and need replacing. The alternative of purchasing new parts could become expensive so another idea is to purchase used components. This could save a lot of money eventually. It is a good idea to buy used lift truck parts that have been reproduced. These parts would ensure that you are getting components which would work for a long time and be productive.

Worn or broken parts which are remanufactured are a less expensive solution than rebuilding. With rebuilding parts, only the components that are broken or worn out get changed, which means that other wearable components could break down soon after acquisition.

Remanufactured components are cleaned after being taken apart and have the unusable parts replaced. This technique could offer the best assurance for used parts. All wearable components are replaced regardless of age or wear which is another rationale why reproduced components generally function so much better. Any component within the part is new and this offers much longer life to the second-hand part. Based on the forklift components which are being redone, the cleaning process and the entire remanufacturing process will differ.

After complete disassembly, the engines are oven cleaned. Various components of the engine like for example spark plugs, pistons, rings, valves, valve springs, and filters could be replaced during the remanufacture process. The engines are hot tested after reassembly to guarantee that there are no leaks, no noises, no oil pressure problems or any vacuum.

Transmissions are another item that is oven cleaned after being disassembled. The transmission is then pressure washed. A complete inspection is done to check for any cracks. Bushings, seals and bearings are all replaced. Usually, the replacement components used on transmission components meet OEM specifications.

A few parts like for example the water pump, torque converters, the alternator, steer axles and the starter could get longer serviceability after being remanufactured and having all wearable components replaced. The electronic control in the electric lift truck is maintained by the control card. This particular card can even be reproduced with replacing all aged and worn out components. Unlike various forklift parts the control card can only have the worn and aged parts replaced.

Components which are reproduced have to be meticulously checked upon reassembly to guarantee they are in good condition prior to being sold. When purchasing these components, it is a good idea to be certain that they have undergone all of the proper testing and inspections. On certain bigger parts such as steer axles, engines and transmissions, OEM specification replacement parts must be utilized.

The dealer of used lift trucks and components can guarantee that the remanufactured components have met OEM specifications and that these parts meet industry standards. A lot of details go into remanufacturing used components. This attention to detail provides more serviceability out of reproduced components opposed to the parts that were simply rebuilt.
